

Text for "About Us" Link 3

"In Japan, ElectroChem fuel cells are used as the standard fuel cells, with which users compare the performance of fuel cells manufactured by themselves. Also the cells are used for evaluating the electrical performance of new materials.

ElectroChem has also manufactured some custom products for Japanese users including

1 cm<sup>2</sup> fuel cell, 5 cm<sup>2</sup> fuel cell with H<sub>2</sub>-reference electrode, and 25cm<sup>2</sup> fuel cell with reference electrode. These products have been purchased mainly by R&D users in catalyst area, and are still contributing to fuel cells' degradation analysis. "
